1 Syntax Grammar

(types) $\tau ::= \text{bool} \mid \tau \rightarrow \tau \mid \text{nat} \mid \text{list } \tau$
(hypotheses) $A, B ::= \top \mid \perp \mid A \wedge B \mid A \vee B \mid A \supset B \mid \forall x : \tau. A \mid \exists x : \tau. A \mid t = t : \tau$
(terms) $e, t ::= x \mid t \ t \mid \text{true} \mid \text{false} \mid [] \mid t :: t \mid \text{zero} \mid \text{suc}(t)$
(term context) $\psi ::= . \mid \psi, x : \tau$

$$\begin{array}{l} \psi \vdash t : \tau \\ \psi \vdash A \text{ prop} \end{array}$$

2 Specification rules for terms and propositional hypotheses

Note: functions are included as term types, but not directly as term constructors. Instead, function terms are added into the term context (ψ) manually. This simplifies the checker since function type inference is not required.
